Functions

INTRODUCTION TO PYTHON

Hugo Bowne-Anderson
Data Scientist at DataCamp

Functions

- Nothing new!
- type()
- Piece of reusable code
- Solves particular task
- Call function instead of writing code yourself

```
fam = [1.73, 1.68, 1.71, 1.89]
fam
```

```
[1.73, 1.68, 1.71, 1.89]
```

max(fam)

1.89

max()

```
fam = [1.73, 1.68, 1.71, 1.89]
fam
[1.73, 1.68, 1.71, 1.89]
max(fam)
           REM
1.89
 [1.73, 1.68, 1.71, 1.89]
                                      max()
```

```
fam = [1.73, 1.68, 1.71, 1.89]
fam
[1.73, 1.68, 1.71, 1.89]
max(fam)
1.89
 [1.73, 1.68, 1.71, 1.89]
                                      max()
                                                          ▶ 1.89
```

```
fam = [1.73, 1.68, 1.71, 1.89]
fam
[1.73, 1.68, 1.71, 1.89]
max(fam)
1.89
tallest = max(fam)
tallest
1.89
```

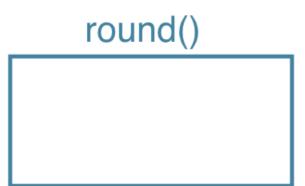

round() REM

```
round(1.68, 1)
round(1.68)
help(round) # Open up documentation
  round(...)
      round(number[, ndigits]) -> number
     Round a number to a given precision in decimal digits (default 0 digits).
      This returns an int when called with one argument,
      otherwise the same type as the number.
      ndigits may be negative.
```

```
round(...)
    round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
    This returns an int when called with one argument,
    otherwise the same type as the number.
    ndigits may be negative.
```

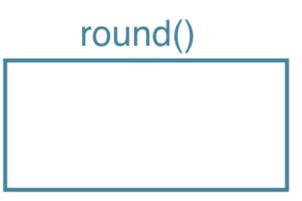

```
help(round)
```

```
round(...)
    round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
    This returns an int when called with one argument,
    otherwise the same type as the number.
    ndigits may be negative.
```

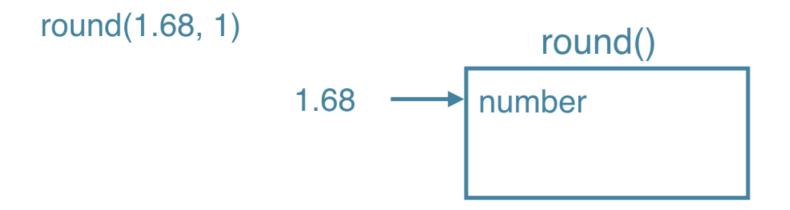

round(1.68, 1)

```
help(round)
```

```
round(...)
  round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
  This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

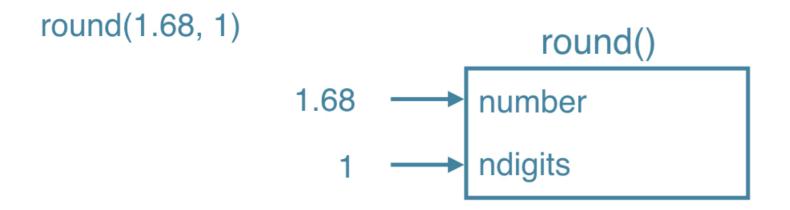

```
help(round)
```

```
round(...)
  round(number[, ndigits]) -> number

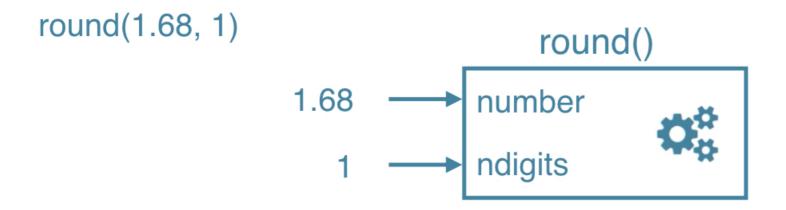

Round a number to a given precision in decimal digits (default 0 digits).
  This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

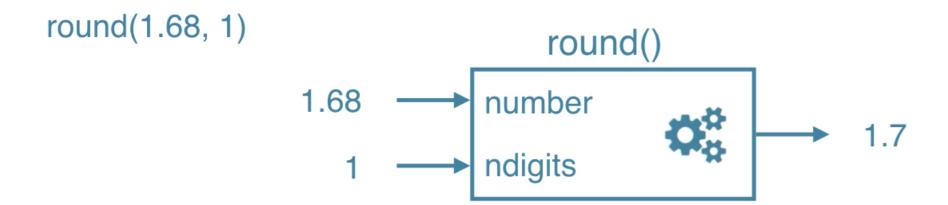

```
round(...)
  round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
  This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

```
round(...)
  round(number[, ndigits]) -> number

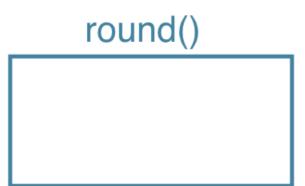

Round a number to a given precision in decimal digits (default 0 digits).
  This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

```
round(...)
    round(number[, ndigits]) -> number

Round a number to a given precision in decimal digits (default 0 digits).
    This returns an int when called with one argument,
    otherwise the same type as the number.
    ndigits may be negative.
```

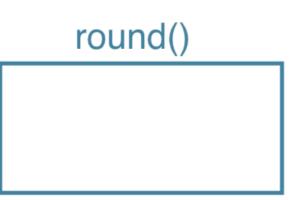

help(round)

```

  This returns an int when called with one argument,
  otherwise the same type as the number.
  ndigits may be negative.
```

- round(number)
- round(number, ndigits)

Find functions

- How to know?
- Standard task -> probably function exists!
- The internet is your friend REM

Let's practice!

INTRODUCTION TO PYTHON

Methods

INTRODUCTION TO PYTHON

Hugo Bowne-Anderson
Data Scientist at DataCamp

Built-in Functions

- Maximum of list: max()
- Length of list or string: len()
- Get index in list:?
- Reversing a list:?

Back 2 Basics

```
sister = "liz"
```

Object

Object

$$height = 1.73$$

Object

```
fam = ["liz", 1.73, "emma", 1.68
"mom", 1.71, "dad", 1.89]
```

Back 2 Basics

 Methods: Functions that belong to objects

Back 2 Basics

```
examples of
                                                     type
                                                             methods
                                             Object
                                                     str
                                                             capitalize()
sister = "liz"
                                                             replace()
                                             Object
                                                     float
                                                             bit_length()
height = 1.73
                                                             conjugate()
fam = ["liz", 1.73, "emma", 1.68
                                             Object
                                                     list
                                                             index()
                                                             count()
        "mom", 1.71, "dad", 1.89]
```

 Methods: Functions that belong to objects

list methods

```
fam
['liz', 1.73, 'emma', 1.68, 'mom', 1.71, 'dad', 1.89]
fam.index("mom") # "Call method index() on fam"
   REMEMBER
fam.count(1.73) REMEMBER
```

str methods

```
sister
'liz'
sister.capitalize() REMEMBER
'Liz'
sister.replace("z", "sa") REMEMBER
'lisa'
```

Methods

- Everything = object
- Object have methods associated, depending on type

```
sister.replace("z", "sa")

'lisa'

fam.replace("mom", "mommy")

REMEMBER

AttributeError: 'list' object has no attribute 'replace'
```

Methods

```
sister.index("z")

2

fam.index("mom")
```

Methods (2)

```
fam
['liz', 1.73, 'emma', 1.68, 'mom', 1.71, 'dad', 1.89]
fam.append("me") REMEMBER
fam
['liz', 1.73, 'emma', 1.68, 'mom', 1.71, 'dad', 1.89, 'me']
fam.append(1.79)
fam
 'liz', 1.73, 'emma', 1.68, 'mom', 1.71, 'dad', 1.89, 'me', 1.79]
```

Summary

Functions

type(fam)

list

Methods: call functions on objects

fam.index("dad")

6

Let's practice!

INTRODUCTION TO PYTHON

Packages

INTRODUCTION TO PYTHON

Hugo Bowne-Anderson
Data Scientist at DataCamp

Motivation

- Functions and methods are powerful
- All code in Python distribution?
 - Huge code base: messy
 - Lots of code you won't use
 - Maintenance problem

Packages

- Directory of Python Scripts
- Each script = module REMEMBER
- Specify functions, methods, types
- Thousands of packages available
 - Numpy
 - Matplotlib
 - Scikit-learn

```
pkg/
mod1.py
mod2.py
```

Install package

- http://pip.readthedocs.org/en/stable/installing/
- Download get-pip.py
- Terminal:
 - o python3 get-pip.py
 - o pip3 install numpy

Import package

```
import numpy
array([1, 2, 3])

NameError: name 'array' is not defined

numpy.array([1, 2, 3])

from numpy import array
array([1, 2, 3])

array([1, 2, 3])

array([1, 2, 3])
```

from numpy import array

my_script.py

```
from numpy import array
fam = ["liz", 1.73, "emma", 1.68,
    "mom", 1.71, "dad", 1.89]
fam_ext = fam + ["me", 1.79]
print(str(len(fam_ext)) + " elements in fam_ext")
np_fam = array(fam_ext)
```

Using Numpy, but not very clear

import numpy

```
import numpy as np
fam = ["liz", 1.73, "emma", 1.68,
    "mom", 1.71, "dad", 1.89]
fam_ext = fam + ["me", 1.79]
print(str(len(fam_ext)) + " elements in fam_ext")
np_fam = np.array(fam_ext) # Clearly using Numpy
```

Let's practice!
